

## **Unique technologies regarding data recovery, at IMW 2015**

In a world in constant motion and increasingly dependent on new technologies, data security is paramount. Often, however, the daily tumult may give rise to undesirable situations where our own errors, mishandling or simple accidents can cause damage to both our computing devices, and especially to the data stored on them.

How many times haven't you accidentally deleted certain files, formatted a hard disk, or more commonly nowadays, have the partition affected by a destroying virus? Add to this the most of the time fluctuations and power failures, caused either by external factors or by overloading networks but also manufacturing defects for which the only solution recommended in most cases, is the replacement of the storage unit.

All these lead to loss of or inability to view files and failure to recognize partitions or hard-disk drivers, with disastrous effects emotionally and economically for all users, but especially for entrepreneurs and companies they represent.

Fortunately, in 85% of cases, our data can be recovered in whole or in part. This however cannot be performed by specialists.

Here intervenes the mission of **Bit Consulting** team, a presence for over ten years on IT&C market in Romania.

Since 2007, **BIT Consulting** has created its own department of BIT Data Recovery, which provides professional services of data recovery from any type of storage unit.

Today, after 8 years of investment and continuous specialization of the staff, BIT Data Recovery became a leader on the market of data recovery services in Romania. We have the latest technology for data recovery, in case of any failure.

Come to know each other better in the period 7-8 October 2015, at Internet & Mobile World, where the Company BIT Consulting will be present for the first time at this event through BIT Data Recovery.

Our speakers will be at your disposal with information and practical presentations about:

- Logic, electrical, mechanical or firmware defects
- Data recovery from any type of ATA, SATA or SCSI hard, USB stick, SD cards, MMC and RAID 0,5,6,10 matrix.
- Advantages, ways of working and opportunities for corporate collaboration
